**SIDS INITIAL ASSESSMENT**

There is need for further work in gathering exposure information.

This chemical warrants special attention because of its genotoxic properties and exposure should be avoided.

**SUMMARY OF REASONS SUPPORTING THE RECOMMENDATION**

TBHP is manufactured in a closed system and used as an initiator or precursor of other initiators which are used in polymerization reactions in the plastics industry.

Based upon the available information, the initial assessment gave indication for concern for humans as well as for the environment. The assessment is considered to be limited by:

- the available exposure data concern for humans only one site in the U.S.A.
- the scarce exposure data for humans as well as the environment.

**FURTHER WORK:**

Further information on human exposure as well as environmental exposure are needed.

A test on inherent biodegradability, a semichronic toxicity test as well as an in vivo chromosome aberration test should be carried out.

Oral NOAL (no adverse effect level) was established at 3mg/kg/day.

RBC
Reticulocyte count was decreased in male rats at dose level of 30mg/kg/day.

Blood
The bilirubin level was increased in male rats of dose groups 10 and 30 mg/kg/day; it was decreased in female rats of 10 and 30mg/kg/day.

Kidney
Treatment related changes in the form of tubular nephrosis were observed in male rats of dose groups 10 and 30mg/kg body weight/day.

Kidney
Multifocal, increased accumulation of tubular proteinaceous material was observed at the dose levels of 10 and 30mg/kg/ day. EDLC was calculated as = 0.02mg/kg/body weight using uncertainty factor.

General Comments
The accumulation of intratubular protein in male rats is considered as male rat characteristic and of low significance for human health. The UF was used as 500 because a fully significant period for this study was considered as 90 days. Recommendation was made for subchronic oral toxicity study (OECD 409).

Oral EDLC (effective dose of low concern) for rat reproduction was calculated as equal or higher than 0.06mg/kg/body weight using UF = 500.

Inhalation EDLC for rat reproduction was calculated from oral EDLC as equal or higher than 0.29mg/m^3 using conversion formula of Van de Meent and Toet.

No embryotoxic, nor teratogenic effects have been found up to the dose of 50mg/kg/body weight.

**General Comments**: Recommendation: although the EHE is higher than EDLC repro, there is no need for a further follow up test since no embryotoxic and teratogenic effects have been found up to a dose of 50 mg/kg body weight.
